Title: [A comprehensive atlas of auto-antibody reactivity in auto-immune disease and cancer](#)

Abstract: Protein arrays have been used for large-scale screening of auto-antibody targets, but published datasets are small. We have used bead-based arrays to test 2000 sera for reactivity against 12.000 full length human proteins. The dataset provides a comprehensive map of auto-antibody reactivity in auto-immune disease and cancer.
